

# Noise Control Simplified

Parklane designs, manufactures and installs custom noise-mitigation systems for a full range of commercial, institutional and industrial applications.

## Don't let **mechanical noise** issues become a distraction

We believe that facility operators and other key project stakeholders should have the freedom to manage and grow their organizations without distraction—leaving noise control issues to our team to handle.

# Parklane Solutions

Parklane's high-performance noise solution product and service offerings can be categorized into six main categories, offered individually or combined to form one integrated system customized to your exact technical specifications.

## Acoustic Barriers and Screens

Mitigate noise emissions from a multitude of sources in one given location.

## Silencer Systems

Attenuate transmission of sound through heating, ventilation and air conditioning (HVAC) systems

## Acoustic Enclosures

Implemented when comprehensive system shielding is required to address site-specific noise level criteria.

## Acoustic Plenums and Louvered Penthouses

Acoustically lined plenums provide insertion loss through absorptive dissipation of sound travelling through the mixed air space.

## Vibration Mitigation

Mitigating structure-borne vibration concerns through defined source identification, anti-vibration component selection, and final system integration/calibration.

# The Parklane Advantage

## Project Certainty

Our comprehensive assessment process is designed to outline a project's full scope to avoid unexpected delays or logistical issues.

## Effective Communications

A collaborative approach enables our team to strategize and deliver a streamlined, worry-free customer service experience.

## Reliable Manufacturing

To improve efficiency and mitigate the risk of on-site rework, we manufacture components in-house to your team's exact technical specifications.

## Cost Control

Our detailed product delivery process allows us to conduct a clear cost-risk assessment to ensure your project is completed on time and on budget.

# Effective Project Management

At the outset of every engagement, we assign a dedicated project manager—an engineer with technical understanding and installation expertise—as your single point of contact. Our process is designed to minimize complexity and deliver guaranteed results:

## Assessment

We identify core project deliverables, risk factors and solution-design requirements

## Analysis

Our team analyzes your unique noise and vibration characteristics and system properties

## Design

We select base components, while outlining a plan for their functional integration

## Implementation

Our team manages the manufacture, installation and on-site integration of your

# Noise Control Simplified

We're dedicated to your success. Whether working with industry, acoustic engineers and consultants, or contractors, we're committed to providing effective solutions to noise and vibration challenges—no matter the size or scope.
